1) Overall product structure

The app can be organized into 6 main surfaces:

1. **Onboarding**
2. **Home / Dashboard**
3. **Stock Detail / Chart View**
4. **Guided Trading Assistant**
5. **Portfolio / Watchlist / Alerts**
6. **Learning / Review**

A user should be able to move through the product in this order:

Sign up → risk profiling → watchlist creation → stock exploration → guided analysis → trade decision → portfolio tracking → post-trade review → learning loop

---

2) Onboarding flow

2.1 Welcome screen

What the user sees

- App name
- One-line intro
- Two primary buttons:
    - Start with guidance
    - Explore as guest / demo mode

What happens

The app immediately asks the user whether they want:

- a beginner-style guided experience
- a trading-style experience
- a mixed experience

This defines the default interface.

2.2 Risk and experience profile setup

What the user sees

A short sequence of 5–7 screens or one multi-step form.

Inputs asked

- Investment horizon
- Experience level
- Preferred market style:
    - short-term
    - intermediate-term
    - long-term
- Comfort with risk
- Capital range
- Preferred instruments:
    - stocks
    - ETFs
    - mutual funds
    - derivatives, if supported later
- Language preference

What happens

The app stores this into a **user profile layer**.
This profile decides:

- how much detail to show
- how aggressive suggestions should be
- what learning path to unlock
- what warnings to surface

2.3 Permission and account setup

What the user sees

Depending on the product stage:

- mobile number login
- email login
- broker account connection
- demat/trading account linking
- optional PAN/KYC flow if real trading is enabled

What happens

The user either:

- enters demo mode, or
- links an account for live data and live execution

2.4 Initial watchlist setup

What the user sees

The app asks the user to select:

- sectors
- companies
- themes
- indexes
- “stocks I follow”
- “stocks I own”

What happens

This creates the first personalized feed and makes the app useful immediately.

---

3) Home / dashboard flow

This is the first real working screen.

3.1 Home screen layout

Top section

- Portfolio risk score
- Market condition status
- Summary of today’s alerts

Middle section

- Watchlist risk cards
- Holdings risk cards
- Active event alerts
- Suggested review items

Bottom section

- Search bar
- Learn
- Portfolio
- Assistant
- Trade

3.2 Home screen behavior

What the app does

The home screen is not a news dump. It acts like a **control center**.

It should show:

- which holdings are under pressure
- which stocks are near important levels
- whether there is event risk
- whether the user's portfolio is too concentrated
- whether any stock needs review today

User actions from home

- tap a stock
- tap a risk alert
- open assistant
- open portfolio
- open learning module
- open trade screen

---

4) Stock discovery flow

4.1 Search screen

What the user sees

A search bar with:

- stock name
- ticker

- sector
- theme
- company name

What happens

Typing a stock name returns:

- exact match
- related companies
- sector peers
- recent alerts
- chart access
- risk summary

4.2 Discovery cards

Each stock card should show:

- current price
- daily change
- risk score
- trend status
- event tag
- holding/watching status
- a short AI note

Interaction

The user can swipe, tap, save, compare, or open chart.

---

5) Stock detail flow

This is one of the most important parts of the app.

5.1 Stock detail page structure

The page should have 5 tabs or sections:

1. Overview
2. Chart
3. Risk

4. Events / News
5. Assistant

5.2 Overview tab

What the user sees

- company name
- industry
- short business summary
- market cap
- basic stats
- current market status
- summary of recent movement

What happens

This gives the user the base context before analysis begins.

5.3 Chart tab

What the user sees

- price chart
- volume bars
- timeframe selector
- indicator toggle
- highlighted zones
- risk markers
- support/resistance annotations

Chart behavior

The chart should not be a raw technical chart only. It should have overlays such as:

- support zone
- resistance zone
- breakout zone
- breakdown zone
- high-risk extension zone
- invalidation area

User interaction

The user can:

- tap on a candle
- drag across a zone
- select a time period
- ask the assistant about any part of the chart

5.4 Risk tab

What the user sees

A structured risk panel with separate categories:

- volatility
- liquidity
- event risk
- trend stability
- portfolio fit
- price extension
- concentration impact

What happens

Each category should have:

- a status
- a short explanation
- a severity level
- a note on whether it is improving or worsening

This is where the app expresses its **risk-first logic**.

5.5 Events / news tab

What the user sees

A filtered timeline of relevant information:

- earnings
- filings
- results
- policy/news impact
- sector movement

- company-specific events

What happens

The app ranks items by relevance and removes low-value noise.

---

6) Guided trading assistant flow

This is the core “help me while I trade” feature.

6.1 Assistant entry points

The assistant should be accessible from:

- home screen
- stock page
- chart page
- order screen
- portfolio page
- learning page

6.2 Assistant UI format

The assistant can appear in three modes:

Mode A: Side panel

A persistent panel beside the chart or stock screen.

Mode B: Bottom sheet

For quick questions or quick explanations.

Mode C: Full-screen chat

For deeper guidance and learning.

6.3 Assistant interaction flow

Step 1: user asks a question

Examples:

- “Is this a breakout?”
- “What is this candle?”
- “Should I enter here?”
- “What is the risk?”

Step 2: assistant reads current context

It uses:

- current stock
- chart position
- user profile
- watchlist status
- holdings if relevant
- market event context

Step 3: assistant responds with structured output

The response should always include:

- what it is seeing
- what pattern or condition it detects
- what the risk points are
- what level of confidence it has
- what next action is available

Step 4: action buttons

Below the response, the assistant should offer buttons like:

- mark stock
- add alert
- open chart level
- save as watchlist
- prepare order
- learn more
- simulate trade

---

7) Highlight-and-explain chart flow

7.1 Feature behavior

When the assistant identifies a meaningful region on the chart, it should:

- draw a translucent highlight
- label the zone
- attach a short explanation
- allow tap-to-expand detail

7.2 Example flow

User opens chart.
App notices price is near resistance.
It highlights the zone.
It shows:

- “Resistance zone”
- “Price has reacted here 3 times”
- “Break above with volume may change structure”
- “Failure here increases rejection risk”

This makes the chart interpretable in real time.

---

8) Trade setup flow

8.1 Trade setup screen

This screen appears when the user wants to act on a stock.

What it contains

- entry range
- stop-loss range
- target range
- risk-reward ratio
- setup validity
- time horizon
- confidence marker
- scenario conditions

8.2 Flow

Step 1

User taps “Trade” from stock page.

Step 2

App shows a pre-filled setup summary.

Step 3

User chooses:

- buy / sell
- quantity
- order type
- horizon

Step 4

App updates the risk impact live:

- exposure change
- portfolio concentration
- risk score impact

Step 5

User confirms or revises.

---

9) Pre-trade review flow

This is a critical flow.

9.1 Pre-trade review screen

Before execution, the app should show a review card containing:

- selected stock
- order size
- estimated risk
- position size vs portfolio
- event status
- stop-loss reminder
- risk warning if applicable

9.2 Flow behavior

If risk is elevated, the app should:

- require a short acknowledgement
- optionally ask the user to confirm rationale
- suggest a smaller size
- suggest waiting
- allow user to save as watchlist instead of trading immediately

9.3 Final execution

Only after review does the app allow the user to place the order.

---

10) Portfolio flow

10.1 Portfolio overview

What the user sees

- total value
- P&L
- risk score
- sector spread
- concentration
- open positions
- watchlist status

10.2 Position detail

Each holding should open into:

- current gain/loss
- entry price
- average cost
- stop-loss reference
- volatility risk
- event risk
- technical status
- assistant note

10.3 Portfolio action flow

From portfolio, the user can:

- review holding
- reduce position
- add alert
- open chart
- open learning module
- export journal record

---

11) Watchlist flow

11.1 Watchlist structure

Watchlist should not be just a list. It should be ranked by:

- urgency
- event relevance
- setup maturity
- risk level
- user interest

11.2 Watchlist item behavior

Each item shows:

- price
- daily move
- risk badge
- watch reason
- alert status
- “ready to review” label if relevant

11.3 Watchlist actions

- pin
- mute
- add alert
- compare
- open assistant
- convert to trade setup

---

12) Alerts flow

12.1 Alert types

Alerts should be triggered by:

- price crossing a level
- volume surge
- trend break
- event date approaching
- risk score change
- portfolio concentration breach
- stop-loss breach
- unusual movement

12.2 Alert delivery

Alerts should appear:

- on home screen
- as push notification
- in inbox
- inside stock page

12.3 Alert flow

User taps alert → app opens the relevant stock or holding → app preloads the reason for the alert → user can act or dismiss.

---

13) Learning flow

13.1 Learning home

This should have two branches:

- Technical guidance
- Knowledge-based guidance

13.2 Technical guidance flow

Modules

- chart basics
- candle meaning
- trend reading
- support/resistance
- breakouts
- stop-loss
- position sizing
- risk-reward

UX behavior

Each lesson should follow:

1. concept
2. example
3. chart illustration
4. micro-quiz or interaction
5. application to live stock

13.3 Knowledge-based guidance flow

Modules

- company context
- sector comparison
- event relevance
- earnings interpretation
- news filtering
- market regime understanding

UX behavior

Each topic should be attached to a real stock or market situation, not just textbook text.

---

14) Trade journal flow

14.1 Journal entry screen

After a trade, the app asks the user to record:

- why they entered
- what setup they saw
- what they expected
- whether it was emotional
- what happened

14.2 Review screen

Later, the app shows:

- what worked
- what failed
- whether the setup was valid
- whether the issue was entry, exit, sizing, or timing

14.3 Flow result

This creates a loop:
trade → record → review → learn → improve

---

15) Simulation / paper mode flow

15.1 Demo mode

The user can test:

- chart interpretation
- trade setups
- assistant guidance
- portfolio tracking
  without putting real money at risk.

15.2 Flow

- choose paper mode
- pick stock
- receive guidance
- place simulated order

- track hypothetical result
- review outcome

This is especially important for first-time users.

---

16) Emotional control flow

This is not a separate screen only. It is a system behavior.

16.1 Trigger situations

The app should detect patterns like:

- too many trades in short time
- repeated entries after loss
- buying a stock after a large spike
- panic selling after a dip

16.2 Intervention flow

When triggered, the app can:

- show a short interruption card
- ask for trade intent
- show current risk
- suggest a pause
- offer “review setup” instead of “execute now”

---

17) End-to-end user journey examples

Journey A: Beginner user

1. Signs up
2. Selects beginner mode
3. Completes risk profile
4. Sees a simple home screen
5. Opens a stock
6. Reads company context
7. Views highlighted chart zones

8. Asks assistant what a pattern means
9. Saves stock to watchlist
10. Enters learning module
11. Later revisits with more confidence

Journey B: Active trader

1. Opens app in the morning
2. Sees risk alerts
3. Opens watchlist
4. Opens a stock chart
5. Assistant explains the setup
6. App shows stop-loss and invalidation
7. User starts order flow
8. Pre-trade review appears
9. User confirms trade
10. Position appears in portfolio
11. Later, trade is reviewed after exit

Journey C: Intermediate investor

1. Checks portfolio health
2. Sees concentration warning
3. Opens one holding
4. Reads event relevance
5. Opens assistant for scenario analysis
6. Decides to hold, reduce, or wait
7. Adds alert
8. Receives a follow-up notification later

---

18) The cleanest UX principle for the whole product

Every screen should answer one of these questions:

- What is happening?
- What is risky?
- What matters now?

- What should I watch?
- What action is available?
- What can I learn from this?

That keeps the product aligned with the flow you want.

---

19) Recommended screen architecture

You should probably build the app around these tabs:

- Home
- Watchlist
- Charts
- Portfolio
- Learn
- Assistant

And inside each stock:

- Overview
- Chart
- Risk
- Events
- Assistant

That structure supports both:

- risk-first navigation
- guided trading behavior
